

Déjà Vu, It's Algebra 2!

Lesson 11

Quadratic Functions: Graphs & Properties

| Degree | Parent Function | Name | Graph |
|---------------|------------------------|-------------|---|
| 1 | $f(x) = x$ | Linear |  <p>Slanted Line</p> |
| 2 | $f(x) = x^2$ | Quadratic |  <p>Parabola</p> |

Forms of Quadratic Equations

Standard Form: $f(x) = ax^2 + bx + c$ $a \neq 0$

Example:

Graph the following function using a table:

$$f(x) = x^2 + 2x - 1$$

| x | $f(x) = x^2 + 2x - 1$ | $(x, f(x))$ |
|-----|-----------------------|-------------|
| -3 | | |
| -2 | | |
| -1 | | |
| 0 | | |
| 1 | | |
| 2 | | |

Vertex Form: $f(x) = a(x - h)^2 + k$

Example:

$$f(x) = x^2 + 2x - 1$$

Completing the Square

Transformations of the parent function

$$f(x) = x^2$$

TRANSLATIONS or SHIFTS

Horizontal shift for $h > 0$

$$f(x - h) = (x - h)^2$$

moves **RIGHT** h units

Ex) $g(x) = (x - 3)^2$

$$f(x + h) = (x + h)^2$$

moves **LEFT** h units

Ex) $g(x) = (x + 3)^2$

Vertical Shift for $k > 0$

$$f(x) + k = x^2 + k$$

moves **UP** k units

Ex) $g(x) = x^2 + 3$

$$f(x) - k = x^2 - k$$

moves **DOWN** k units

Ex) $f(x) = x^2 - 3$

Example:

Put the following equation into vertex form, then sketch the graph using transformations.

$$f(x) = x^2 - 6x + 4$$

Déjà RE-Vu

Putting it all together

Put the following equation in vertex form, and then sketch the parabola.

$$h(x) = -2x^2 + 16x - 29$$
