Lesson 12, page 1 of 8

Quadratic Functions: Reflections & Dilations, Roots, Max & Mins

 $\frac{\text{REFLECTIONS}}{\text{of } f(x) = x^2}$ 

Reflection across y-axis  $f(-x) = (-x)^2$ Input values exchange

Reflection across x-axis

 $-f(x)=-x^2$ 

Output values exchange

# DILATIONS: STRETCHES & COMPRESSIONS

of  $f(x) = x^2$ 

Vertical Dilation for  $\alpha > 0$  $f(x) = \alpha x^2$ 

If a > 1Vertical Stretch away from *x*-axis Ex)  $g(x) = 2x^2$ 

If O < a < 1 Vertical Compression towards *x*-axis

Ex)  $g(x) = \frac{1}{2}x^2$ 

# Horizontal Dilation for b > 0 $f(bx) = (bx)^2$

If b > 1Horizontal compression towards y-axis Ex)  $g(x) = (2x)^2$ 

If 0 < b < 1Horizontal stretch away from y-axis Ex)  $g(x) = \left(\frac{1}{2}x\right)^2$ 

#### **Example:**

Sketch the graph of  $f(x) = -3x^2$ 

Mathematical "Synonyms"

- *x*-intercpets of the graph of a parabola
- roots of a quadratic function, f(x)
- zeros of a quadratic, f(x)
- solutions to the equation f(x) = 0

These values are generally more difficult to find than the y-intercpets, are much more meaningful, in terms of real-world applications.

Factoring is one way to solve quadratic equations:

**Example:** 

Find the zeros of  $f(x) = 2x^2 + 2x - 12$ 

Example: Find the roots of the following equation.  $g(x) = -3x^2 - 9x$ 

## Example: Find the *x*-intercepts of the following equation. $h(x) = 2x^2 - 8$

## Déjà RE-Vu Application

The height and velocity of a ball thrown straight up with an initial velocity of 28 feet per second from an initial height of 4 feet can be modeled by the following respective equations:

$$h(t) = -16t^2 + 28t + 4$$
  
 $v(t) = -32t + 28$ 

- b) At what time does the ball reach its maximum height?
- c) How long is the ball in the air?
- d) What is the velocity of the ball as it hits the ground?
